COMP348: Ass 1 Part 1, A Sample Report

Mark Dras (40123456)

March 6, 2008

1 Introduction

A task that has interested many organisations around the world is to determine the characteristics of the writers of particular texts. Is the writer young or old? Male or female?

Some more introductory text. Some introductory text.

2 System Description

AdAge uses the recently developed Very Clever Algorithm.

3 Experiment and Results

As data we have classifications for N blogs by AdAge, along with their actual classes.

We choose as a baseline BLAH BLAH; the accuracy rate for this baseline is BLAH BLAH.

For the AdAge system, BLAH BLAH.

Some results. Some results.

To determine whether the accuracy rate for the AdAge system is statistically significantly different from the baseline, we use the BLAH BLAH test, as follows:

BLAH BLAH

This score is significant at the BLAH BLAH level.

4 Conclusion

Clearly, with accuracy rates significantly above the baseline, the AdAge algorithm is an effective approach to classifying blog posts by age of poster. (Or not.)
